The method of home blood pressure monitoring has been validated and is a useful tool for the management of hypertension. However, the evidence for the effectiveness of home blood pressure monitoring in reducing cardiovascular events is not yet established. This volume presents the available evidence on home blood pressure monitoring, discusses its strengths and limitations, and presents strategies for its optimal implementation in clinical practice. Written by distinguished international experts, it offers a complete source of information and practical guidance for healthcare professionals working with the management of hypertension.

In 2010, an estimated 50 million people were uninsured in the United States. A portion of the uninsured reflects unemployment rates; however, this rate is primarily a reflection of the fact that when most health plans meet an individual’s needs, most times, those health plans are not affordable. Research shows that people without health insurance are typically to experience a delay in the provision of health care, which can lead to worse health outcomes. With the Affordable Care Act, uninsured Americans have greater access to affordable health insurance. The act has made major changes to improve access to care for all Americans. The expansion of Medicaid to cover more low-income individuals is a key component of the act. The success of the ACA depends on the ability of states to implement the law effectively.
